ABSTRACT

This manual describes the dissemination and communications plan of the project BeXyl, with Grant Agreement 101060593. It aims to ensure that the project results reach the intended beneficiaries and provides a set of practical guidelines to the BeXyl consortium.

This document sets up the working procedures for dissemination and communication, indicating also the people in charge of some key roles. It will act as a guide for BeXyl consortium members, and it may, therefore, be considered crucial for the overall success of the project. Also, these rules will ensure comply with the obligations detailed in the Grant Agreement 101060593 signed with European Commission.

This document was jointly written by the project's Coordination Team in collaboration with the WP9 leaders, to provide instructions and guidelines for the communication and dissemination activities of BeXyl project. It is a complement to all other key documents that the Coordination Team and BeXyl Consortium should have read and have access while the project is running including the EC Grant Agreement (GA) and its annexes, along with the Annotated Model Grant Agreement (AGA version 0.2, November 2021).

Funded by the European Union

1. INTRODUCTION

In order to meet the objectives of BeXyl project it is necessary to implement the project communication, dissemination and exploitation plan in order to maximize the project visibility and to ensure the best exploitation of project results.

Communication in and from the Consortium has to be precise, but flexible to the changing needs of different informative activities, transparent, attractive, innovative and unified within the large number of actors within the framework of the Consortium. Sustainable ways of conducting the informative activities are of high importance, utilizing virtual working environments whenever compatible with the dissemination objectives. In short, the leading principles of communication in the BeXyl Consortium are:

- Attractive, flexible and unified communication
- Precise and scientific
- Aligned to the needs of stakeholders

This Plan will be led throughout the project, by the WP9 Leaders (P26-Surrender MS and P31-BGCI), overseen by the Coordinator team (CT), implemented by all partners and monitored by the Management Board (MB). The content of the communication, dissemination and exploitation plan may be adjusted during the Consortium period. Any major amendments shall be approved by the management Board (MB) and the General Assembly (GA), while adjustments of a more technical nature can be directly approved by the Coordinator Team.

2. TARGET GROUPS

To reduce the economic and social impacts of *Xylella fastidiosa*, a complex emerging pathogen, BeXyl will promote a comprehensive and multidisciplinary EU research strategy for settling an effective response and implementation of IPM approaches, to manage *X. fastidiosa*-associated diseases and to maximize exploitation of project results, hinging on establishing collaborative researcher-stakeholder partnerships.

The consortium relies on active cooperation and stakeholders' engagement before and during the project lifetime to ensure a multi-actor approach as enforced by the new plant health policies (Regulation EU 2016/2031). An active stakeholders' engagement has been promoted since the preparation of the proposal, taking into account the critical research gaps identified by EU farmers, Agri-Cooperatives, nurseries and risk managers (i.e., outcomes of the EU Conference on *X. fastidiosa* 2019 & 2021). An overview of the research gaps identified by the different actors are shown in **Figure 1**. A large board of stakeholders have already been engaged (See **Annex 1**), and many other stakeholders will be involved during the project lifetime to ensure a wider participatory approach and effective knowledge transfer. Capitalizing on available knowledge, BeXyl will provide added value to practices, tools, and policy recommendations through different channels, among them EIP-AGRI Operational Groups (OGs), and by clustering with similar EU funded projects (e.g., PurPest, REACT) or communication channels on same pathogen (e.g., InfoXylella, PTI-SolXyl).

Funded by the European Union

Figure 1. Research needs identified by farmers and foresters, nursery producers, risk managers and policy makers during EFSA conferences on *Xylella fastidiosa*.

Targeted measures for different types of beneficiaries will be used for dissemination, communication and exploitation of the project activities and results. The Consortium will combine events, publications, and internet tools to disseminate project results specifically oriented to different target groups described in sections 2.1 to 2.6.

2.1 Farmers

This group encompasses both professionals in the sector (leaders, technical staff, agronomy/forestry consultants, farmers/foresters and Nurserymen, technical operators, etc.) and related professional associations.

Their potential in communication tasks is enormous as they can function both as receivers and senders of information in task like definition of research needs, dissemination of the results, farmer/forester capacity building trainings, awareness campaigns, and promotion of farmer uptake of IPM management strategies (conventional and organic sectors).

2.2 Risk managers

This group consists of diagnostic laboratories and phytosanitary inspectors. Within their communication capacities, they would highlight the training of laboratory staff and inspectors, as well as the training of their technical staff in all protocols related to *X. fastidiosa* diagnostics or monitoring and sampling.

2.3 Legislators

This group includes actors of vital importance for the dissemination and communication of the project that can be grouped into official agencies, plant health services and policy makers.

Funded by the European Union

Its foreseen contribution to the project through the design and implementation of official control measures, optimization of surveillance programs for early detection and impact analysis based on project scientific outputs, will be much more efficient if it is accompanied by a strong dissemination and communication campaign of these activities.

2.4 Research community

The role of the scientific community has three main pillar roles which are peer-review of BeXyl results, capacity building and dissemination of projects results.

Through instruments such as scientific papers, methods and protocols, databases, simulation models and algorithms the information to be disseminated and communicated shall be prepared.

2.5 Civil society

The general public is the widest and most diverse group in itself, offering challenges from heterogeneity at different levels to geographical distances between people, as well as diverse attitudes towards BeXyl's project objectives.

Messages will be tailored to suit the chosen target group's interests addressing issues, such as pest management programs, environment, and agricultural techniques instead of scientific jargon. Thus, the BeXyl Consortium intends to translate the EU priorities and objectives to a more general language shared by the citizens and the stakeholders though specific printed and digital material.

2.6 Industry

The agri-food industry focuses its involvement on project results and in the exploitation guidance and recommendation (case studies, applications).

This exploitation results can be reflected through scientific and technical publications, software and standards, new methods and prototypes.

3. DISSEMINATION TASK FORCES

The Consortium envisages three key groups (Task Forces) of known composition to drive the key dissemination activities of the project:

- All partners: Activating and maintaining the **BeXyl network.**
- WP9 leaders and their teams: **Broadcasting project activities.**
- Stakeholders set: Forming the **Practitioner Panel** for continuous interactions.

3.1 Task Force 1: BeXyl Network

To amplify the reach of the communication a European network of actors involved in grassroots communication on *X. fastidiosa* will be established, aimed at mitigating the risks of new *X. fastidiosa* introductions and further spread in the European territory. This community will be animated to provide inputs for the communication activity and to operate as a platform to amplify the outreach of messages and contents. Through the knowledge sharing, exchange experiences and good practices, the most relevant contents for the public

Funded by the European Union

will be posted on the website and social media. The social media management oriented to interact with the target audience, by documenting and sharing new project outcomes, workshops, meeting, and other activities considered for external communication. After the completion of BeXyl an online community will be operating to share science-based information on *X. fastidiosa* and contribute to expose misinformation at the European scale.

3.1.1 Ways of working

The activities of the BeXyl Network should be reflected in a variety of ways of working, as follows:

Documentation (Templates, seminars, conferences, training, workshops…)

For all these activities, guidelines will be established in line with the general communication strategy.

Specifically, a **toolkit** will be created containing the graphics to be used for the production of documents, articles, social media posts, and in general any material to be used for internal and external communication. The toolkit will contain the visual identity of the project, including the visual identity of the European Horizon programme, and it will be available through the partner's cloud and a website section.

Internal Communication

The internal communication between partners is defined at the D10.2 Operational Manual (Point 3.1). This deliverable specifies the communication channels between partners, which should preferably be traceable such as e-mail, videoconference, cloud workplace (BeXyl management) and phone calls.

Four online meetings – one per year – will be organized by WP9 leader Surrender MS with the persons in charge of communication for each partner of the Consortium. The aims of these meetings are to:

- Present the initiatives that every partner intends to develop in the project
- Exchange experiences and good practices
- Define and update the rules and recommendations for a correct use of external communication tools
- Launch of the intranet of the website as a platform for internal communication
- Study the map of interactions of the partners to expand the reach of communication, both in the social media and the press

The meetings will be preparatory to the coordination between the persons in charge of communication of the various partners. The objective is to select the information most useful for external communication (point 5.1).

At this end, a "Members Area" will be created on the website for the consortium to use. In this section of the website, consortium members will be able to share all the material (presentations, pictures, papers, minutes) produced in the project. It will be a one-stop information spot reserved for the participants in the project.

Funded by the European Union

External Communication

The Consortium's lifetime consists of the start-up, implementation and final phases. Necessary communication actions will vary between these periods.

In the start-up phase, external communication focuses on making the Consortium visible for the different actors and stakeholders outside the Consortium.

In the implementation phase as results are obtained, greater information flow is needed. Consolidated results will need to be delivered to the broader academic public and other target groups (**Figure 1**), stressing the importance of EU funding in obtaining these results.

In the final phase, it is necessary to raise public awareness of the overall results, benefits and accomplishments of the Consortium. The details are defined at Task force 2: Broadcasting project activities.

3.2 Task Force 2: Broadcasting project activities

The BeXyl project web portal (**https://www.bexylproject.org/**) will be the reference tool to support the project visibility and the dissemination of the results. It will provide an extensive overview of the project's aims, achievements and public deliverables, addressing technical aspects that are of interest to the stakeholders and end-users. The core of the dissemination strategies will be emotional video stories, documentary and animated infographics for farmers and the society highlighting the scientific basis of control measures as well as the impacts of *X. fastidiosa*, focusing also on the research activities and sustainable management solutions provided by BeXyl. The general aim is to show how research and innovation can help the agricultural/forestry sectors to remain productive and sustainable.

Open access will be granted to all scientific publications and relevant research data generated in BeXyl according to Articles 29.2 and 29.3 of the Grant Agreement (GA), and in line with FAIR principles (Section 1.2.4 of GA). The most applicable and relevant results will be disseminated by practise abstracts submitted to the EIP-AGRI platform and by specific formats for targeted communications with stakeholders.

The resulting innovative knowledge from this project will feed into the EIP-AGRI (The agricultural European Innovation Partnership) website for broad dissemination to practitioners. End-user material will be produced in the form of a number of summaries for practitioners in the EIP common format ("**practice abstracts**").

3.2.1 Ways of working

Social media

The use of social media (Twitter, Facebook, Instagram, LinkedIn, YouTube) will be proactive and oriented to interaction with the public: every new discovery, event, public meeting, call for citizens and farmers surveillance from one partner – considered valuable for external communication – must be documented with videos and/or photos and shared.

A raising awareness campaign led by Surrender MS mostly focusing on project results will be launched on social media. The campaign will focus on the background, impacts and results of the project.

Funded by the European Union

Although they do not have many followers yet, the project's social networks have started up very actively, so progressive growth is expected. The accounts and the current followers are as follows:

- Twitter (@BexylP): Followers 145
- Facebook (@bexylproject): Followers 37
- Instagram (@bexylproject): 65 Followers
- Linkedin (bexyl-project): 13 followers

Website

As indicated before, the BeXyl project website (**Figure 2**) will be the reference tool to support the project visibility and the dissemination of the results. Currently, it provides an extensive overview of the project's aims, all will be the window to show project achievements and public deliverables. It will also address other technical aspects that are of interest to the stakeholders and end-users.

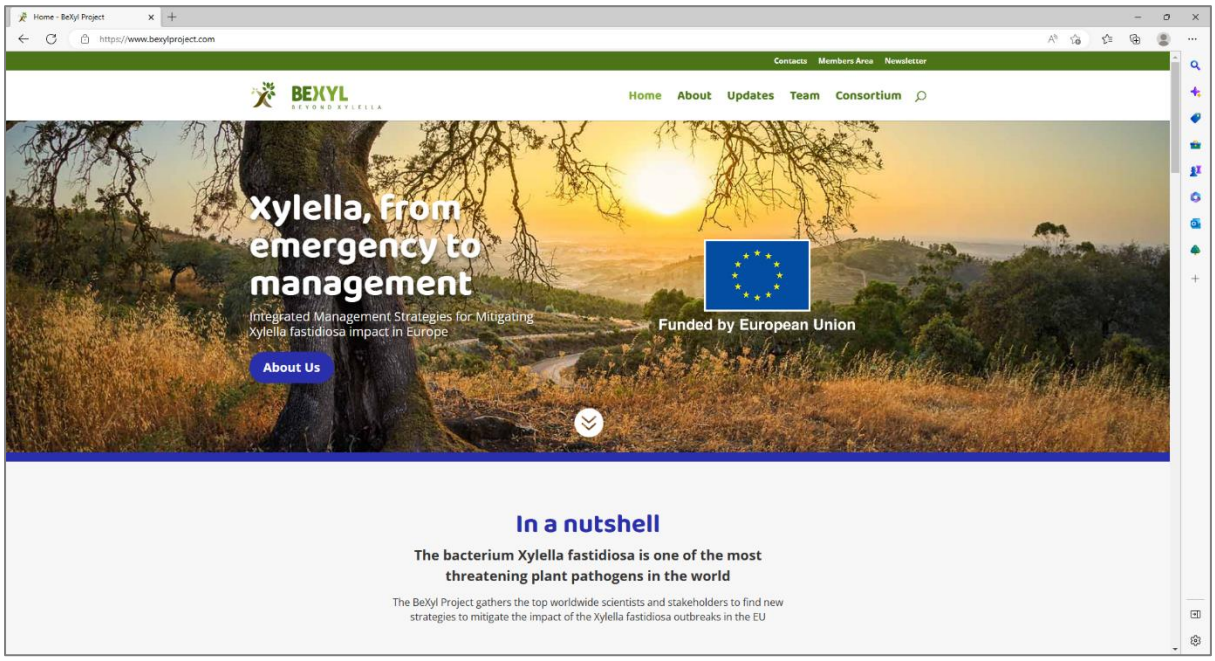

Figure 2: BeXyl website

Their contents will be used to provide information on the developments and results of the project actions. The website will be updated periodically by Surrender MS, and the news will also be the basis of posts on the project's social channels (Facebook, Instagram, Twitter, LinkedIn and YouTube). The general and national contents will also be disseminated by the websites and social media of the partners.

The project website (**Figure 2**) is running since the end of November 2022, and the number of visits is growing as expected. The statistics for the first 3 month are shown in **Table 1**.

Funded by the European Union

Table 1: BeXyl website statistics

Date	Visitors	Unique Visits	New Visits	Return Visits
November, 2022	363 4.30%	132 5.30%	132 6.01%	0
December, 2022	2,249 26.67%	624 25.05%	588 26.79%	36
January, 2023	3,316 39.32%	945 37.94%	857 39.04%	88
February, 2023	2,506 29.71%	790 31.71%	618 28.15%	172
Total	8,434	2,491	2,195	296

Newsletter

A monthly newsletter is being disseminated throughout the community. The newsletter has the main objective of informing the consortium members on the progress of the project, but will also contain useful information for readers outside the consortium and who are part of the dissemination target groups: consortium and individual partner activities, interviews with researchers from the consortium at from outside, news related to the project themes, videos and photos produced by the partners.

The 3 first newsletter have been distributed to subscribers and are available in the website (See **Figure 3**).

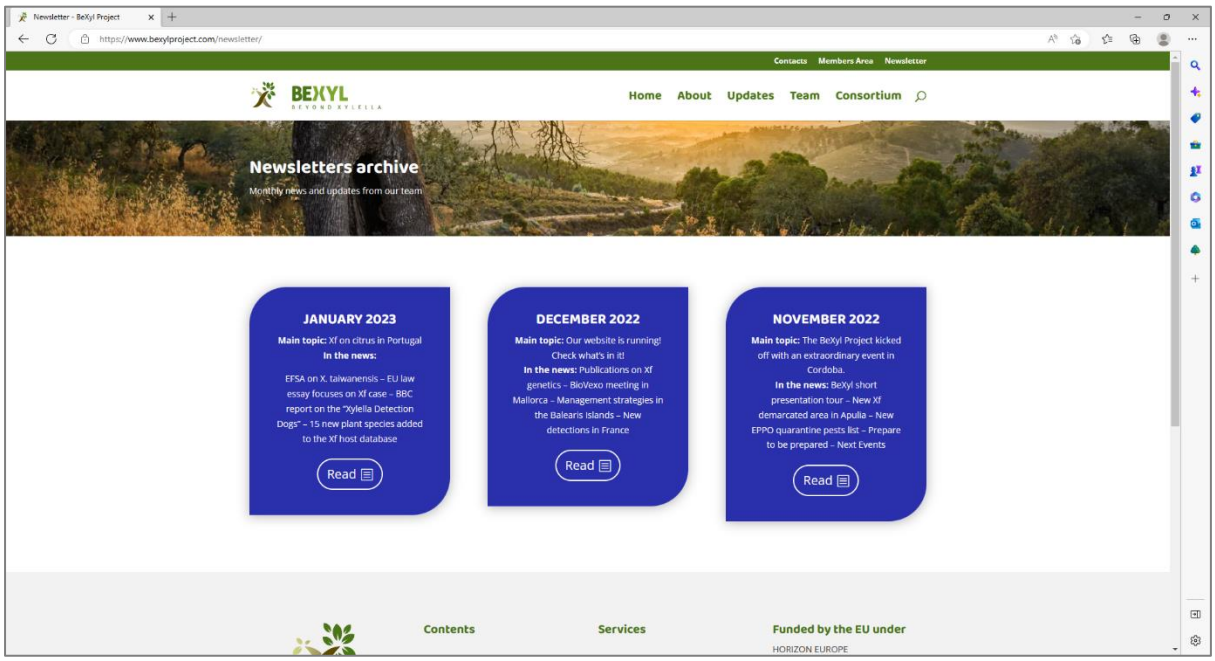

Figure 3: BeXyl Newsletter

Funded by the European Union

Info Pack for media providers

The WP9 coordinator, Surrender MS, will set up a network of media providers interested to support the action by publishing editorial content related to the project activities and results. In this regard, a dedicated Info Pack combining videos, photos, press releases, articles and infographics, will be produced by Surrender MS and spread through the network of press agencies, TV broadcasts, newspapers and news websites at European and local level. The dissemination will take place on two levels:

- At European level through the dissemination of English content to the English-speaking European media
- At local level through the dissemination of national press releases to a selection of national media, in particular the media of the countries to which the partners belong.

For the Info pack and social media, emotional video stories (≥8), and documentary and animated infographics will be produced focusing on three main strands:

- The social and economic implications for the stakeholders affected by *X. fastidiosa*
- The ecological impact of *X. fastidiosa* spread and establishment
- The activities and results of the project
- The role of the EU and the Horizon Europe program.

The awareness campaign will show the results of the project, showing how research and innovation can assist the agricultural/forestry sectors to remain productive and contribute to sustainable agriculture/forest health in line with the Farm to Fork strategy.

The target audience of the emotional videos will be farmers and other stakeholders impacted by *X. fastidiosa,* scientists and NPPO officials. Each video will have a maximum duration of 5 minutes and will be edited with the use of graphics and animated video infographics. The videos will be re-edited to adapt to various social media. The interviews will be conducted throughout at least four EU countries. The videos and contents produced will also be edited in a long form of a 20 minutes video documentary.

***Xylella* files**

A series of seminars on different topics related to *X. fastidiosa* research are being organized by partners P9-AU and P10-UC from USA. The series of seminars are offered in each academic semester. The list of the current semester speakers is provided in **Annex 2**. The speakers include not only researchers participating in BeXyl but any researcher, policy maker or stakeholder member, etc. involved on any field involving *X. fastidiosa* from basic research to applied management, policy, risk managers, etc.

Every week the registered people will receive an email with the zoom link and the abstract of the talk. In the first semester of 2023, we have sent out a survey for the audience to propose topics that they want to discuss, and in the last meeting of the semester a panel will be assembled to discuss the selected topics.

All meetings will be conducted by **Zoom** on Tuesdays at 11AM (Central Standard Time, UGM-6h). To attend the meetings, it is necessary to register in advance because the email list is curated. The attendants need to have a Zoom account to log in, otherwise the P9-AU and P10-UC accounts would not allow them to join the seminars. Talks will not be recorded. The attending scholars are welcome to follow a No Publication/Photography Policy according

Funded by the European Union

to the guidelines of the Gordon Research Conferences (https://www.grc.org/about/grc-policies-and-legal-disclaimers/). The latter is particularly important as we hope the series will promote the work of junior scientists and increase synergies. Finally, the attendees are asked to respect each other and their mutual work as part of the shared community of researchers studying *X. fastidiosa*.

Societal activities of plant health research

Co-design activities in BeXyl involve workshops and focus groups with stakeholders, NPPOs and EPPO participating in outbreak response programs for *Xf* as well as farmers implementing crop restoration and IPM programs in current outbreak areas in the EU.

Those activities will be catalysed mainly through WP9, involving also members of the Advisory Board and the Practitioner Panel and local experts.

Co-creation activities in BeXyl are fully implemented through involving citizen science, that is also considered in WP2 to improve early detection of *Xf* with passive surveillance by citizens.

Likewise, the most relevant nursery association (P20-ENA) actively participates in WP6 to develop thermotherapy treatments (TT) for planting materials and will provide a tool for disseminating best practices for TT treatments to different nurseries in Europe.

Additionally, through the WP9 co-leader BGCI, a series of communication and dissemination will be performed in collaboration with the network of the botanical gardens and arboreta that form part of the BGCI network. The main aim is to develop citizen science, outreach activities, and knowledge exchange to improve awareness of *X. fastidiosa*, its potential impacts and how it spreads. For that, BeXyl will make use of the database and communication resources developed within the BRIGIT project (https://www.jic.ac.uk/brigit/) to adding value to those resources after the lifetime of the BRIGIT project.

3.2.2 Key Performance Indicators

The communication measures (defined in point 5 below) within BeXyl are tightly coupled with the different dissemination activities and the target audiences and expected metrics are shown in **Table 2**.

Updating the website and social media posts will be done periodically. We expect a minimum of 60 blog posts and 60 newsletters to be published on the website. We also expect a minimum publication of 240 posts and 40 videos on the project's social media accounts. Some of these contents could also be shared by the websites and social media of the consortium members.

Audience related KPIs will be monitored periodically on a monthly basis. This monitoring will serve to evaluate any changes to the dissemination strategy, identifying themes and types of posts that are best suited to reaching the target groups.

The KPIs relating to the production of audio-visual and textual content will also be monitored on a monthly basis. A general review of the KPIs is scheduled for the Update Plan and Final Report deliverables planned in month 24 and month 47 respectively. The revision will be discussed with the consortium members for its approval.

Funded by the European Union

Table 2. Communication metrics and audience indicators

Communication Channel	Key Performance Indicator	Stakeholders/Target audience	KPI target
Website	No. of visitors to the **BeXyl** website during the project lifetime	ALL	250K
	No. of blog post on **BeXyl** website 'News' section	ALL	60
Social media	No. of posts via social media channels	ALL	240
	Expected audience	ALL	500K
Website, social media channels & other online	No. of articles /posts in consortiums' newsletter / website/social media/other comm. platforms	ALL	60
	Expected audience	ALL	300K
Press media & articles	No. of press releases & articles	ALL	10
	Expected audience	European and local media	
Videos	Videos supporting social media posts; emotional videos (5 minutes) for website and social media; video documentary; animated infographics	Scientific community / General public	40; 8; 1; 9
Events	No. of BeXyl conferences and workshops at which consortium will promote organized with EFSA or other national agencies, and events organized with the network of botanical gardens from BGCI	Academia/Scientific community/General public	8
Seminars	No. of seminars	Academia/Scientific community/ Policy makers/Risk managers	95
	Expected audience		1000
Simulation exercise	No. of simulation exercises organized by **BeXyl**	ALL	1

3.3 Task Force 3: Practitioners Panel

To facilitate the continuous interactions and their active involvement BeXyl has created a Practitioner Panel (PP) of stakeholders representing different sectors and profiles:

- Official agencies, Plant Health Services, policy makers;
- Farmers/foresters and nurserymen;
- EIP-AGRI OGs;
- Diagnostic laboratories and phytosanitary inspectors;
- Companies providing agricultural inputs or services;

Funded by the European Union

BeXyl foresees different dissemination strategies targeted for the different stakeholders and adapted to each region/country/crop-economic-social system (Table 3). Dissemination activities are a core part of the project. Clear, specific, and measurable objectives are key to the success of any dissemination strategy. They will be aligned with major deliverables to maximize the impacts of the project and in strong interaction with all the other WPs.

The Practitioner Panel (PP) will be appointed from representatives belonging to international and national Plant Protection and quarantine services, policy makers, growers, producers and nurserymen organizations, EIP-AGRI OG members and extension services. It will be formed before the 9 month of the project and the conclusions of the meeting will be reported as a milestone of the project.

Table 3. Description of stakeholders and target audience profiling and contribution to BeXyl impact

Stakeholder profile	Major contribution to BeXyl impact	Target audience	Main Instruments	Main dissemination activity or event	Exemplar stakeholders (not exhaustive lists)
Professional associations of farmers-foresters, nurserymen. Operational Groups (OG)	Definition of research needs, dissemination of the results, farmer/forester capacity building trainings, awareness campaigns, promote farmer uptake of IPM management strategies (conventional and organic sectors)	Leaders, technical staff, agronomy/ forestry consultants and farmers/ foresters Technical operators	Stakeholder board meetings. Project meeting minutes. Trainingmaterials: videos,webinar, best management practices, digital applications	Collaborative platforms, networking in face meeting and social media, web page, workshops and field demonstrative events. Practise abstracts, printed and digital materials	COPA-COGECA(EU), IOC (Int.) Coldiretti (IT), P24-UNAPROL (IT), DOP Terra d'Otranto (IT) OGs from Italy & Spain Az. Melcarne CIVITALIA, P27-AI and P19-ENA associates
Official agencies, Plant health services, Policy makers	Design and implementation of official control measures, optimization of surveillance programs for early detection. Impact analysis based on project scientific outputs	Policy makers, risk managers and risk assessors and technical staff	Practice abstracts, technical reports, disease risk maps, optimized surveillance guidelines, contingency plans, policy recommendations	Collaboration platforms, networking, workshops, simulation excises, printed or electronic materials	P20-EPPO, EURL in Bacteriology, EFSA, National PPOs (NPPOs) of the EU participating countries

Funded by the European Union

Stakeholder profile	Major contribution to BeXyl impact	Target audience	Main Instruments	Main dissemination activity or event	Exemplar stakeholders (not exhaustive lists)
Diagnostic laboratories &phytosanitary inspectors	Capacity building of lab staff and inspectors, training of its technical staff.	Lab technical staff and field inspectors	Trainings, tutorials, best laboratory practices, inspection and sampling guidelines	Networking in face, training workshops. Open science database.	EURL in Bacteriology and its network of NRLs, NPPOs
Research community	Peer-review of BeXyl results, capacity building, dissemination of projects results	Scientists, research managers, students	New knowledge, scientific papers, methods and protocols, databases, simulation models & algorithms	Scientific meetings, publications. Open science databases.	R&D+i professionals
Civil society, citizens	Communication of project results and practical outcomes	Lay public, general audience	Specific printed and digital material on IPM programs and impacts of invasive diseases for different audiences	Educational materials, brochures, press releases, news indifferent media, awareness campaigns	Non-Governmental Organizations (NGOs), social action groups
Industry	Project results and exploitation guidance and recommendation (case studies, applications)	Innovators, industry consultants	Scientific and technical publications, software and standards, new methods and prototypes	Innovation networks and workshops	Industry platforms, innovation hubs

3.3.1 Ways of working

Co-assessment activities will be implemented through the Practitioners Panel, to monitor and evaluate the progress of the activities and check that proper interactions with the civil society are made.

Periodic meetings of the Practitioner Panel to discuss with stakeholder's representatives of the TT treatments potential, implementation of IPM tools, etc.

Disseminate the decisions taken at the Expert Group meeting to all interested parties, respecting confidentiality.

Funded by the European Union

4. EXPLOITATION OF PROJECT'S RESULTS

4.1. Management of intellectual property

BeXyl proposes a complete range of activities leading to the optimal visibility of the project and its results, increasing the likelihood of market uptake and ensuring a smooth handling of the individual intellectual property rights (IPR) of all Partners, thus paving the way to knowledge transfer.

A specific task in WP10 will articulate an IPR observatory by means of the General Assembly. The overall IPR strategy will be established since the beginning to ensure that all Partners are free to benefit from their complementarities and to fully exploit their market position, and will support the further exploitation of the project results, ranging beyond the project's actual duration.

For the three SMEs (P22-ACIES BIO, P23-RG PROJECTS, P25-AIBE) participating to the consortium, exploiting the project results offers a key strategic opportunity for the longer-term development of their business (e.g., P22-ACIES BIO, will scale up the microbiological formulations; P23-RG PROJECTS can manufacture and sell the validated equipment for TTs to members of P19-ENA; P25-AIBE can produce and commercialize at large scale resistant/tolerant almond and olive genotypes). The IPRs to be declared in the frame of the proposed activity will be limited to the partners of BeXyl, which will respect the confidentiality of facts, information, knowledge, documents or other matters communicated to them as confidential.

BeXyl will provide innovation potential in three categories covering different technology readiness levels (TRL) from TRL3 'experimental proof of concepts' to TRL8 'system complete and qualified'. Transdisciplinary research conducted in cooperation with stakeholders will develop and validate new solutions from experiments (basic research innovations) to market ready products and services (technological innovations):

- Identification of cultivars, accessions and rootstocks of grape, olive, almond and other important crop species with enhanced resistance to *Xf* to be used in restoring outbreak areas or in breeding programs (TRL4/5).
- Validation under field conditions of environmentally-friendly approaches for *Xf* control (use of plant resistance, microbiome-primed plants more resilient to *Xf* infection, bacteriophages, new antibacterial compounds) and its vectors (Entomopathogenic fungi (EF), virus, predators) (TRL4/5).
- Validated protocols of thermal treatment to guaranty production and safe trade and movement of healthy material of different *Xf* host and specified plant species for nursery industries and germplasm banks (TRL7/8).
- New innovative and validated tools for monitoring and detection of *Xf* and its vectors including molecular methods and remote sensing (TRL7/8).
- Optimized statistical designs for surveillance of *Xf* and its vectors (TRL7/8).

A consortium agreement (CA) has defined in detail rights and obligations of the partners with respect to the IPR, among other aspects. The overall purpose of this agreement is to maximize the return on investment for the European Commission, as well as maximizing the partners

Funded by the European Union

chance to offer innovations to the market, jointly or alone, under the fairest conditions for all. The CA will be tailored to the partners needs and have clauses facilitating industrial exploitation of the project results concerning: i) background knowledge; ii) results; iii) access right in general; and iv) open access to scientific publications.

4.2. Potential business exploitable opportunities

The potential business exploitable opportunities that BeXyl has identified concerning technological innovations are defined before (Section 4.1). Some examples of potential business exploitable opportunities are:

- New entomopathogenic fungi and other potential natural enemies including viruses with an insecticidal effect and predatory insects could act as biocontrol agents against *Xf* vectors. The use of these agents as biocontrol agents could be patented.
- Novel compounds showing antimicrobial activity against *Xf* and/or with plant defence elicitor activity, based on functional peptides, glasses/glass-ceramics and natural plant extracts from side-streams of 'alperujo' could be patented.
- The industriability potential of synthetic microbial communities of xylem-inhabiting bacteria with key traits against *Xf* to increase plant resilience to infection will be determined and the procedure for its cultivation in low-cost media can be patented.
- The discovery of plant effectors, metabolites, or physiological signatures that can discriminate between susceptible and resistant genotypes could be patented as fast and reliable tools for breeders to screen germplasm for resistance.
- New olive and almond genotypes (cultivars) resistant to *Xf* obtained through controlled cross-breeding.
- Novel protocols to sanitize plant propagation materials by TTs.

4.3. Exploitation Plan to end users and companies

Analysis of research results in terms of innovation potential, implementation of IPR protection measures, or open innovation models will be periodically done by the Exploitation Committee (EC) based on the internal project reports, deliverables and ad hoc meetings.

The role of the EC is to assist the partners with an Exploitation Plan to facilitate the proper exploitation of both for the background and for the results developed within BeXyl. It will also include actions such as the presentation of the Exploitation Plan to end users and companies (month 47) to ensure exploitation of project results (not restricted to marketable products) beyond the project lifetime, for a period of at least 3 years after the end of BeXyl.

4.4. Exploitation Committee

The Consortium acknowledges the importance of IPR and innovation management for research results developed within the project. To support this task an **Exploitation Committee** (EC) has been appointed at month five from the beginning of the project, with members (experts in legal protection and commercialization) chosen within the consortium and

Funded by the European Union

outside. Each member has signed a letter of commitment and confidentiality, which is attached in Annex 2. The role of the EC is to assist the partners with an Exploitation Plan to facilitate the proper exploitation of both for the background and for the results developed within BeXyl.

The Exploitation Committee has been appointed with the mission or ensuring the best path to achieve the market uptake of the project results, through:

- identification and assessment of all the project results
- reporting the marketable project results
- preventing unapproved public disclosure of results by the RTD performers
- ensuring the quality of the protection strategy in accordance with the CA
- ensure adequate protection is in place prior to exploitation and dissemination.

4.4.1 Members of the Exploitation Committee

The Exploitation Committee for BeXyl Project will consists of the following members of the consortium:

- P1-CSIC: B. B. Landa (Experience in protecting by patents by patents molecular diagnostics protocols and Microorganisms of agronomical interest)
- P1-CSIC: P. Domingo (Experience in protecting by patents bacteriophages against multi-drug resistant bacteria, in protecting know-how, and by contracts with private companies. In addition, experience launching a spin-off)
- P3-UCO: E. Quesada (Experience in protecting by patents microorganisms for use as biocontrol agents of pests)
- P4-UdG: E. Montesinos (Experience in protecting by patents microorganisms for use as biocontrol agents of plant pathogens and functional peptides for plant disease control).
- P11-ARO: O. Bahar (Experience in protecting patents for microorganisms use as biocontrol agents)
- P18-IFAPA: L. León (Experience in protecting new olive cultivars from cross-breeding programs by Plant Breeder Rights)
- P22-ACIES: G. Kosec (Experience in IP protection and commercialization of innovative biotechnological products and technologies)
- P23-RG PROJECTS: S. Giménez (Experience in designing of thermotherapy equipment and protecting them)
- P25-AGROMILLORA: M. Bordas (Experience in protecting by patents new varieties of fruit trees by Plant Breeder Rights and Patents)

Additionally, the following members are proposed outside the BeXyl Consortium:

- P1-CSIC: J.R. Domínguez Solís (experience in management of Intellectual Property Rights – in particular Patents; he Works at the Commercial Strategy and Internationalization Area of the Deputy Vice Presidency of Knowledge Transfer, CSIC)

Funded by the European Union

- P5-CNR: A. Naso (experience in management of Intellectual Property Rights – in particular Patents, New Plant Varieties and Trademarks - and related tech transfer actions; she works at the Unità Valorizzazione della Ricerca, CNR)

5. COMMUNICATION ACTIVITIES

Communication activities aim to draw attention of target audience on the project activities, fostering their engagement. Communication is thus an important component of the action implementation and will complement the dissemination and exploitation of results. The communication strategy is intended as outreach activities for public engagement beyond peer-to-peer communication and information transfer. That is, the communication, dissemination and exploitation activities jointly aim to promote the project purpose, actions and results to reach out to a wider audience than the project's own community.

To communicate the action beyond the academic community, BeXyl will develop in cooperation with the project network of stakeholders a communication strategy combining tailored activities aimed to different audiences, with a major focus in public engagement measures. Communication activities add public value to the achievements of the project as it aims to reach a wider audience than the academic community. To this end, research activities must be communicated in a way that can be graspable by non-specialist audiences (e.g. the media and the public) using for this purpose specific communication channels as illustrative videos, documentary and presentations.

5.1 Communication strategy

The core of the communication strategy is the establishment of a European network of actors involved in grassroots communication about *Xylella fastidiosa* as a first step to build up a community of scientists, stakeholders and citizens on *Xylella fastidiosa*, to mitigate the risks related to further spread of *Xylella fastidiosa* in the European territory.

The innovative character of the communication activities of BeXyl relies on the integration of traditional media tools with communication grassroots initiatives in the consortium. In particular, the integration is crucial for the currently fragmented communication initiatives from each member of the consortium, as it is a first step to establish a long-term community of researchers, working beyond the end of the project, in which scientists, stakeholders, and lay public are involved in preventing new *Xf* introductions and spread of current outbreaks in Europe. Also, the global scale of the Consortium enables to expand the communication network beyond the EU.

Community building will follow three main phases.

The first phase is the strengthening of internal communication between partners.

For this purpose, annual meetings (defined at point 3.1.1 Internal Communication) will serve to define a work plan for the following months. Details has been defined at Point 3.2: Broadcasting project activities.

The second phase will concern the involvement of actors external to the consortium, but active in direct communication to stakeholders and lay public about *Xf (*websites, social media profiles and citizen-science based projects such as infoxylella.it in Italy, SolXyl in Spain, and

Funded by the European Union

BRIGIT in the UK. These experiences often do not effectively intercommunicate each other, owing to the various platforms refer to different MSs and territories. The BeXyl project represents a great opportunity for a supranational level of integration of these platforms, resulting in an enhanced exchange of good practices in communication and improved effectiveness, both at internal and external level.

The third phase concerns the involvement in the community of stakeholders, farmers, journalists, social media influencers, students, researchers, and citizens who may be interested in *Xf*-related issues.

In the second and third phases, the engagement strategy of potential community players first of all foresees the use of the monthly newsletter, which will also be sent to contacts outside the consortium who will give their consent to receive it. The second tool involves social media community management: sharing content from players outside the consortium, reposting, tagging, launching and animating discussions. To this end, targeted calls to action could also be launched.

The establishment of a community has huge potential in terms of exploitation, as it has multiplier impact on the communication activities (on websites, social media and citizen science initiatives) of the members of the Consortium beyond the duration of the project. The cross-fertilisation of those fragmented experiences can work also as a learning experience for scientists, as they are not always prepared to deal with the dynamics and potential risks of direct engagement with press, media and the general public. The results of this kind of "training by doing" is exploitable beyond the term of the project. In 4 year-time, this endeavour will take us to build a first online community sharing science-based information on *Xf* and debunking fake news at the European scale.

ACCEPTANCE LETTER

It is my pleasure to accept the invitation to be part of Exploitation Committee of BeXyl Horizon Europe project (Integrated Management Strategies for Mitigating *Xylella fastidiosa* impact in Europe, nº 101060593).

As member of this committee, I am committed to assist the partners with an Exploitation Plan to facilitate the proper exploitation of both, the background and the results developed within BeXyl.

The contribution of the Exploitation Committee will consist of the analysis of research results in terms of innovation potential, implementation of IPR protection measures, or open innovation models. All information generated will be shared with the consortium and it will keep strictly confidential.
